Engineered Stone Marble Surfaces Care & Maintenance

Proper Care and Maintenance

The tips below will help in maintaining the Engineered Stone Surface. Sealing of the product is recommended on an annual basis for enhanced protection and greater durability. The sealant used should be specific to natural stone surfaces. For application, follow the instructions as outlined by the sealant manufacturer, available at kitchen supply, hardware, and home centers.

- For everyday cleaning use a damp cloth, soft sponge or paper towel
- Before applying any cleaning agent, be certain to rinse all of the surface area thoroughly
- For more stubborn stains you can use a neutral pH cleaner and a nonabrasive scrubbing pad
- For more difficult stains use a mild liquid detergent, or stain-specific poultice solution

General Precautions

- It is recommended to use cleaning product that is pH neutral
- Be cautious when exposing your Engineered Stone surface to any household chemicals or solvents. When using any product, it is recommended to test a small inconspicuous area.
- Do not expose Engineered Stone surfaces to any chemicals that contain acetone, methyl chloroform, hydrofluoric acid or methylene chloride - such as paint remover or furniture strippers. These types of chemicals may cause etching or discoloration
- In case of an accidental exposure to products, thoroughly rinse the affected area with water as soon as possible

By following the care and maintenance guidelines, your Engineered Stone surface will provide you with many years of trouble-free use.
